SUMMARY

Full Stack Java Developer with hands-on, project-driven experience building secure, scalable microservices and automation platforms across **Fintech and MarTech domains**. Proficient in Java, Spring Boot, Spring Security, and REST APIs, with production-grade deployments leveraging RabbitMQ, Redis, and PostgreSQL. Independently designed and built Python (FastAPI) microservices integrated with Java applications, alongside Resilience4j patterns (circuit breaker, rate limiting, retry, bulkhead), AWS S3, Linux administration, and Selenium-based social media automation with advanced multithreading. Passionate about delivering high-availability solutions with strong security, performance, and measurable business impact.

WORK EXPERIENCE

Software Engineer

mPHATEK Systems Pvt Ltd

Aug 2025 - Present

Project: OmnisPay – Live Fintech Payment Gateway Platform

Payment Gateway Integration & Security

- Designed a pluggable payment gateway architecture using the Strategy design pattern combined with a functional Factory pattern, enabling the platform to support 5+ payment gateways (including Tabby) behind a common interface, so new gateways can be onboarded without modifying existing orchestration logic.
- Implemented runtime gateway resolution: each merchant's active/assigned gateway is read from configuration at the time a payment link is generated, and a functional factory. Instantiates the correct strategy object (e.g., PaymentStrategy) on the fly — eliminating conditional branching (if/else or switch) across the codebase.
- Collaborated with senior engineers to integrate the Tabby international payment gateway into this strategy-based orchestrator, implementing the gateway-specific request/response mapping, transaction lifecycle handling, and webhook-based status updates while conforming to the shared PaymentGatewayStrategy interface used by all gateways.
- This design decoupled merchant-specific gateway selection from core payment link generation logic, improving extensibility and reducing time to onboard future gateways.
- Designed a hybrid encryption scheme combining AES (symmetric) and RSA (asymmetric) to secure communication between backend services and client/frontend applications.
- This approach improve 35+ overall security posture for client-facing communication.
- Worked alongside senior engineers to implement HMAC-based security for guest checkout payment link generation on an e-commerce product, developing complete end-to-end understanding of the HMAC validation flow.

Asynchronous Processing

- Designed an event-driven, asynchronous invoice generation pipeline using RabbitMQ to decouple invoice creation from the main payment link generation request flow.
- On every transaction, an invoice-generation event is published to a dedicated queue regardless of the user's invoice preference (per admin policy that invoices are mandatory), while the payment link response is returned to the user immediately without waiting on invoice generation to complete.
- This decoupling reduced payment link generation latency by up to 40% for users who had opted out of receiving invoices directly, since invoice creation no longer blocked the critical response path.

Security Vulnerability Remediation (VAPT)

- Independently resolved a VAPT-flagged device-fingerprint authentication vulnerability in the mobile app: designed a RabbitMQ-based consumer mechanism to detect and invalidate a previous user's encrypted device ID when a new user logged in on the same device — eliminating cross-user activity notification leaks without impacting system performance.
- Resolved multiple API tampering vulnerabilities identified during VAPT audits.
- Implemented rate limiting on payment link generation APIs to remediate a VAPT-identified abuse vector.

Access Control & Performance

- Implemented a custom JWT authentication filter (extending OncePerRequestFilter) that validates incoming requests based on both user role and request origin domain, enforcing strict separation between user-facing and admin-facing portals at the filter layer before requests reach controllers.
- Optimized filter performance by caching role-to-domain mapping/comparison data in Redis, fetched once from PostgreSQL and reused across requests — eliminating repeated DB round-trips on every authenticated request and significantly reducing filter-layer latency.
- Built a scheduled cleanup job (@Scheduled, cron-based, once daily) to evict stale/expired entries from the Redis cache, keeping cache size bounded and comparison data fresh without manual intervention.
- Net effect: reduced redundant database calls on the authentication path while maintaining strict domain-based access control between portals. Developed and deployed 30+ production-grade secure REST APIs using Java, Spring Boot, and Resilience4j (circuit breaker, rate limiter) patterns.
- Built and deployed application JARs to containerized environments as part of release workflows.

Project: Social Voice – Social Media Automation Platform

- Developed an internal automation platform enabling bot accounts on Instagram, Facebook, and Twitter to automatically post text and images from a centralized dashboard, eliminating manual posting effort.
- Engineered multithreaded execution engine: when 50 bot accounts are selected, accounts are partitioned into configurable blocks (e.g., 5 accounts/block) and executed concurrently — each thread independently handles one block, maximizing throughput and resilience.
- Implemented Java Selenium automation for Chrome browser login and activity simulation across social media platforms, enabling realistic human-like interactions.
- Built secure inter-service communication between Java and Python microservices, handling request validation, response processing, error handling, and retry mechanisms for reliable execution.

Software Developer (Intern)

DesignTech Systems Pvt Ltd.

Project: Marine Item Management System

- Developed responsive web interfaces using HTML, CSS, and JavaScript, enhancing usability and accessibility across multiple devices.
- Collaborated with development teams to implement frontend features and improve overall user experience.
- Debugged and resolved UI issues, ensuring consistent functionality and visual quality across the application.

Jun 2024 – Aug 2024

TECHNICAL SKILLS

- Languages:** Java (8/17), Python, JavaScript, HTML, CSS
- Frameworks:** Spring Boot, Spring Security, Spring JPA, React, Redux, FastAPI (Basic)
- Messaging & Cache:** RabbitMQ, Redis, Apache Kafka
- Resilience:** Resilience4j — Circuit Breaker, Rate Limiting, Retry, Bulkhead, Fallback
- Automation:** Java Selenium (Chrome browser, social media automation), Multithreading
- Cloud & DevOps (Basic):** AWS (S3), Linux, Docker, Git, SLF4J/Logback
- Databases (Basic):** PostgreSQL, MySQL
- Core CS Fundamentals:** Data Structures & Algorithms, Problem Solving, Object-Oriented Programming
- API Standards:** REST APIs, Microservices, JWT Authentication, Encryption/Decryption

EDUCATION

Marathwada Mitra Mandal's College of Commerce (MMCC)

Savitribai Phule Pune University

Bachelor of Business Administration in Computer Applications (BBA-CA)

CGPA :- 8.25

Jun 2021 – April 2024

CERTIFICATIONS

Full Stack Java Developer Certification

Gained practical experience in end-to-end Java web application development.

Claude Code 101 – Anthropic Academy

Completed Anthropic's official course on using Claude Code as an AI coding agent for daily development workflows, including the Explore → Plan → Code → Commit workflow.

AI Fluency: Framework & Foundations – Anthropic Academy

Completed Anthropic's foundational course on effective, responsible collaboration with AI systems.

Oct 2023 – May 2024

2026

2026

HOBBIES

- Coding
- Listening to Music
- Fitness
